VOICE • LANGUAGE • CLARITY

ArogyaDhwani

A multilingual voice bridge for clearer healthcare conversations.

6 LANGUAGES	VOICE-FIRST	HUMAN-REVIEWED

01 / THE CHALLENGE

Language gaps can make it harder for patients to explain symptoms and for care teams to understand what was said. Manual interpretation and typing can interrupt the flow of a consultation.

02 / THE RESPONSE

ArogyaDhwani turns spoken input into visible text, translates it between supported languages, and organises explicitly stated details into a reviewable patient form.

03 / HOW IT WORKS

01	02	03	04	05
Speak	**Transcribe**	**Translate**	**Structure**	**Speak back**
Patient speaks naturally in a supported language.	Gnani.ai Prisma converts speech into text.	The message is translated into the selected language.	Smart Form Filling maps only stated details; unknowns stay blank.	Gnani.ai Timbre turns text into audio output.

04 / WHAT MAKES IT USEFUL

■ Six-language access
English, Hindi, Kannada, Tamil, Telugu and Malayalam.

■ Visible conversation
Transcripts and translated text remain available for review.

■ Structured details
Multi-sentence input can populate relevant patient fields.

■ Voice output
Text-to-speech supports spoken communication.

TECHNOLOGY

Gnani.ai Prisma STT • Gnani.ai Timbre TTS
Python • FastAPI • HTML / CSS / JavaScript

INTENDED IMPACT

Reduce avoidable language friction and help conversations stay understandable, reviewable and organised.

Responsible use: ArogyaDhwani is a communication-support prototype, not a diagnostic or treatment tool. Translations and extracted details require review by a qualified healthcare professional. The demonstration should use fictional patient information.
